A number of techniques used to study protoscoleces viability were assessed. These included the incubation of Echinococcus granulosus protoscoleces at 37 degrees C in the presence of rabbit serum or in serum-free medium. They were also exposed to heat (46 degrees C for 10 min), autoclaving (121 degrees C for 15 min), and lyophilisation. The effect of prolonged freezing (at -20 degrees C) and thawing (at room temperature) was also examined. Protoscoleces survival at room temperature was better than that observed in the freeze-thaw technique. Protoscoleces isolated from infected sheep were more viable than those from sheep infected by cystic echinococcosis. Protoscoleces in different stages of development (newborn, 6-month-old, 15-month-old) survived better at 37 degrees C in rabbit serum than at 37 degrees C in autologous sheep serum, and the percentage of normal protoscoleces was higher in the latter. These observations suggest that the use of a suitable protein source during cultivation might be a valid approach for the production of a vaccine. Evaluation of the electromigration behavior of neutral polymer nanoparticles in a free-standing DNA crystal. Electrokinetic studies in free-standing DNA crystals are complicated by electroosmotic flow that tends to vary the orientation of the crystalline lattice and the surface charge of the crystal. Using an optical tweezers-based method, we determined the mobility of a fluorescently labeled polymer nanoparticle in a free-standing DNA crystal. The mobility of the nanoparticle was monitored by tracking the particle position at a rate of 1 Hz over 4 h. The slow, collective diffusion of the nanoparticle through the DNA crystal was shown to be consistent with a reptation-based mechanism. A bus carrying students to prom in the Bronx turned around and drove back to the school because a suspected gunman was believed to be armed and on the loose. The New York Post reported that the incident occurred Wednesday morning in the 39th Precinct. "We were in the 39th — we were on our way to school and we saw cops and stuff and we stopped to

In the past, third-party applications were available for mobile devices that were restricted to a few platforms. Even then, manufacturers might make exceptions and supply a third-party app to specific models, such as the recently released Pebble smartwatch. With the explosion of Android-based smartphones and tablets, it's now becoming possible to download any app and to access Android applications on a Windows Phone. However, there's one exception: HTC. While HTC has just released its new HTC One (M8), it's only the second One model that will not support third-party applications. But don't worry, this may change in the future. Over on the Nexus Apps site, a HTC representative, contacted David Wang, whose Nexus app development company works on Android applications, to ask about the reasons behind the Android-only apps. The representative mentioned HTC has not given the developer any indication why the apps would be available on other mobile operating systems. According to Mr. Wang, the representative informed him that the main reason for excluding Android apps from HTC's One (M8) is to provide better user experience. "Given that some HTC applications are poorly designed, we've made the decision to provide a better user experience by offering only apps from the official Android Store," said the representative. One could understand this, especially for companies like HTC, which is not a direct competitor of Google. But it's obvious that if this is the sole reason for the change, Android-only apps could be available for the next One model. While not official, the HTC representative confirmed that all the HTC One (M8) smartphones will have access to the Android apps. According to him, the only issue is the devices' design and industrial manufacturing. He also said the decision will be reviewed after the One (M8) is launched. But will this decision last? We can only hope so. There's nothing wrong with relying on the Google Store and making it easier to obtain
